

# Lecture 16

## Asymptotic Analysis

- method for describing limiting behavior
- study of the properties of a function

- In **Computer Science**, AA is the evaluation of the performance of an algorithm in terms of the input size  $(n)$ , where  $n$  is very large

## Algorithm

A finite set of precise instructions to solve a problem

- every algorithm is constructed using a finite set of statements

## Simple C Statements

### ① Expressions

`printf`

`scanf` - read formatted data

`assignment statements` - set  $a := |$

## ② Jump Statements

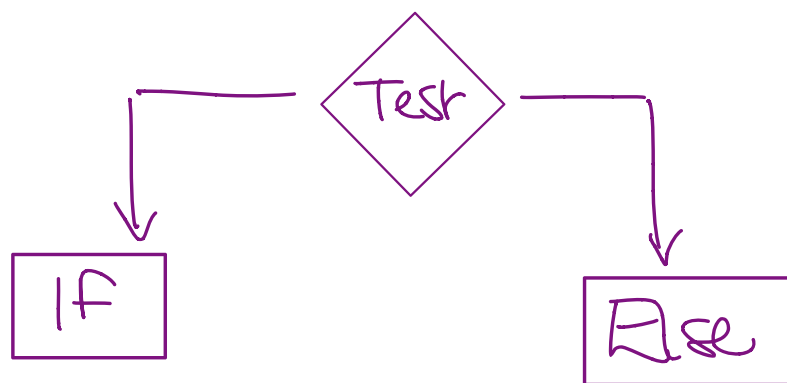

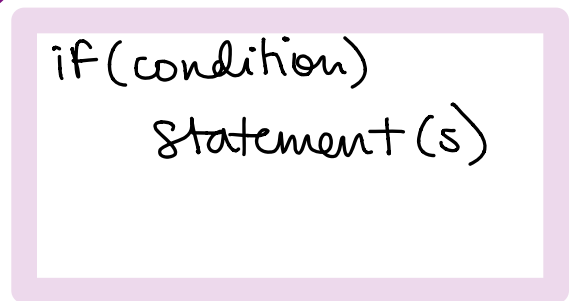

goto, break, continue, return, etc.

## ③ Null statement

;  
; → nothing happens

## Rules for Constructing Statements (From smaller statements)

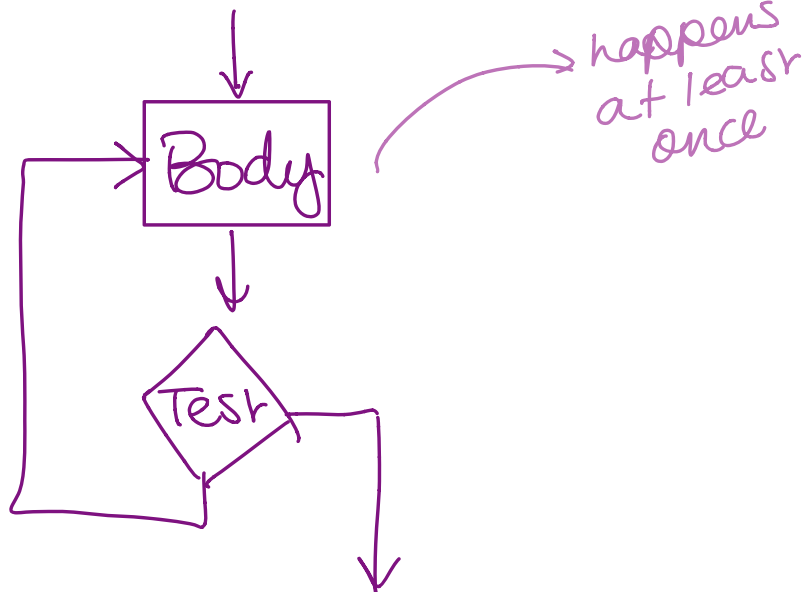

①

② for (initialization; termination ;  
incrementation)

③ while (condition)  
statements

④ do - while statement

```
int i=0;
do
    printf(i);
    i=i+1
while(i<=5)
return 0
```

⑤ "Missing" (switchcase)

⑥ Block

```
printf("a\n");  
printf("b\n");
```

output  
a  
b

## Choosing An Algorithm

- program w/ small amounts of data
  - USE EASIEST TO IMPLEMENT ALGORITHM
- program to be used & maintained by many people over a large period of time

- ① Simplicity
- ② Clarity
- ③ Efficiency (especially for large size problems)

## Running Time

- amount of time it takes measured as a function of the size of the input ( $f(n)$ )

### Input size

- size of an array
- vertices or edges of a graph
- Degree of a polynomial
- Number of elements in a matrix
- etc.
